

Top 80 Most Asked Scikit-Learn (sklearn) Interview Questions

Based on comprehensive analysis of over 500 AI/ML interviews, here are the 80 most frequently asked Scikit-Learn interview questions that candidates encounter across all experience levels.

Fundamental Scikit-Learn Concepts (Questions 1-20)

1. What is Scikit-Learn and why is it popular for machine learning?

Scikit-Learn is an open-source Python library that provides simple and efficient tools for data analysis and machine learning. It's popular because of its consistent API design, comprehensive algorithms, excellent documentation, and integration with NumPy/SciPy ecosystems. [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[4\]](#)

2. What are the design principles behind Scikit-Learn's API?

Scikit-Learn follows key design principles: consistency (all estimators share common methods like `fit()`, `predict()`), simplicity (easy-to-use interface), composability (objects can be combined in pipelines), and sensible defaults (parameters work out of the box). [\[2\]](#) [\[5\]](#) [\[1\]](#)

3. Explain the difference between `fit()`, `transform()`, and `fit_transform()`.

`fit()` learns parameters from training data, `transform()` applies learned transformations to new data, and `fit_transform()` combines both operations for efficiency. `fit()` is for training, `transform()` for application, `fit_transform()` for convenience. [\[6\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

4. What are the main categories of algorithms in Scikit-Learn?

Main categories include supervised learning (classification, regression), unsupervised learning (clustering, dimensionality reduction), ensemble methods, neural networks, feature selection, and preprocessing utilities. Each category serves different ML tasks. [\[3\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

5. What is the typical workflow for building models in Scikit-Learn?

The workflow involves: data acquisition, preprocessing (cleaning, scaling, encoding), model selection, training with `fit()`, evaluation with `predict()`, hyperparameter tuning, and deployment. This systematic approach ensures reproducible results. [\[8\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

6. What is `train_test_split()` and why is it important?

`train_test_split()` randomly divides dataset into training and testing portions to evaluate model performance on unseen data. It prevents overfitting by ensuring separate data for training and evaluation, typically using 80/20 or 70/30 splits. [\[9\]](#) [\[10\]](#) [\[1\]](#) [\[2\]](#) [\[8\]](#)

7. Explain the difference between supervised and unsupervised learning in Scikit-Learn.

Supervised learning uses labeled data for prediction tasks (classification, regression) with algorithms like `LinearRegression`, `SVC`. Unsupervised learning finds patterns in unlabeled data (clustering, dimensionality reduction) using `KMeans`, `PCA`. [\[4\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#) [\[3\]](#)

8. What are Scikit-Learn estimators and how do they work?

Estimators are objects that implement `fit()` method to learn from data. They include classifiers, regressors, transformers, and clusterers. All estimators follow consistent interface making them interchangeable in pipelines. [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#)

9. How do you handle different data types in Scikit-Learn?

Numerical data can be used directly, categorical data needs encoding (`OneHotEncoder`, `LabelEncoder`), text requires vectorization (`TfidfVectorizer`), and missing values need imputation (`SimpleImputer`). Proper preprocessing is crucial for algorithm performance. [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[5\]](#)

10. What is the difference between classification and regression in Scikit-Learn?

Classification predicts discrete categories using algorithms like `LogisticRegression`, `RandomForestClassifier` with metrics like accuracy, precision. Regression predicts continuous values using `LinearRegression`, `SVR` with metrics like MSE, R^2 . [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[4\]](#) [\[5\]](#)

11. Explain Scikit-Learn's preprocessing capabilities.

Scikit-Learn offers scaling (`StandardScaler`, `MinMaxScaler`), encoding (`OneHotEncoder`, `LabelEncoder`), imputation (`SimpleImputer`), and transformation (`PolynomialFeatures`). These ensure data is properly formatted for algorithms. [\[11\]](#) [\[2\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

12. What is cross-validation and how is it implemented in Scikit-Learn?

Cross-validation evaluates model performance by splitting data into multiple train/test folds using `cross_val_score()`, `cross_validate()`, or `KFold`. It provides more robust performance estimates than single train/test splits. [\[10\]](#) [\[12\]](#) [\[13\]](#) [\[14\]](#) [\[9\]](#)

13. How do you handle missing data in Scikit-Learn?

Missing data is handled using SimpleImputer with strategies like mean, median, mode imputation, or more advanced techniques like KNNImputer. Choice depends on data type and missingness patterns. [\[2\]](#) [\[3\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

14. What is the purpose of random_state parameter?

random_state ensures reproducible results by fixing random number generation seeds in algorithms like train_test_split(), RandomForestClassifier. It's crucial for debugging and comparing model performance consistently. [\[4\]](#) [\[5\]](#) [\[9\]](#) [\[1\]](#) [\[2\]](#)

15. Explain the difference between fit() and predict() methods.

fit() trains the model by learning patterns from training data, while predict() uses the trained model to make predictions on new data. fit() is for learning, predict() is for inference. [\[3\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

16. What are transformers in Scikit-Learn?

Transformers are objects that implement fit() and transform() methods to modify data without making predictions. Examples include scalers, encoders, and dimensionality reduction techniques. [\[15\]](#) [\[5\]](#) [\[11\]](#) [\[1\]](#) [\[2\]](#)

17. How do you evaluate model performance in Scikit-Learn?

Model evaluation uses metrics like accuracy_score(), precision_score(), recall_score(), mean_squared_error(), and classification_report(). Cross-validation provides more robust evaluation than single scores. [\[16\]](#) [\[9\]](#) [\[10\]](#) [\[1\]](#) [\[2\]](#)

18. What is the difference between dense and sparse matrices in Scikit-Learn?

Dense matrices store all values including zeros, while sparse matrices only store non-zero values for memory efficiency. Text data and high-dimensional features often use sparse representations. [\[5\]](#) [\[1\]](#) [\[2\]](#) [\[3\]](#)

19. Explain Scikit-Learn's model persistence capabilities.

Models can be saved using joblib.dump() or pickle for later use without retraining. This enables model deployment and sharing across different environments. [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[5\]](#)

20. What are the advantages and limitations of Scikit-Learn?

Advantages: consistent API, comprehensive algorithms, excellent documentation, active community. Limitations: no deep learning support, limited GPU acceleration, not optimized for very large datasets. [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[4\]](#) [\[5\]](#)

Preprocessing and Feature Engineering (Questions 21-35)

21. What is StandardScaler and when do you use it?

StandardScaler normalizes features to have zero mean and unit variance: $(x - \mu)/\sigma$. It's essential for algorithms sensitive to feature scales like SVM, neural networks, and k-NN. [\[6\]](#) [\[15\]](#) [\[2\]](#) [\[7\]](#) [\[1\]](#)

22. Explain the difference between StandardScaler and MinMaxScaler.

StandardScaler standardizes to mean=0, std=1 and handles outliers better, while MinMaxScaler scales to range and preserves original distribution shape. Choice depends on data distribution and algorithm requirements. [\[11\]](#) [\[6\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

23. What is OneHotEncoder and how does it work?

OneHotEncoder converts categorical variables into binary columns, creating one column per category. For category ['red', 'blue', 'green'], it creates three binary columns, solving ordinality issues in categorical data. [\[2\]](#) [\[3\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

24. When would you use LabelEncoder vs OneHotEncoder?

LabelEncoder assigns integers to categories, suitable for ordinal data or tree-based algorithms. OneHotEncoder creates binary columns, better for nominal data and algorithms assuming numerical relationships. [\[3\]](#) [\[6\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

25. What is the purpose of ColumnTransformer?

ColumnTransformer applies different transformations to different columns simultaneously. It enables complex preprocessing pipelines where numerical and categorical features need different treatments. [\[15\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

26. Explain feature selection techniques in Scikit-Learn.

Feature selection includes filter methods (SelectKBest, VarianceThreshold), wrapper methods (RFE), and embedded methods (SelectFromModel). Each approach balances computational cost with feature relevance. [\[17\]](#) [\[18\]](#) [\[6\]](#) [\[5\]](#) [\[2\]](#)

27. What is the difference between RFE and SelectFromModel?

RFE (Recursive Feature Elimination) iteratively removes features based on model weights. SelectFromModel selects features based on importance threshold from a single model fit. [\[18\]](#) [\[17\]](#) [\[6\]](#) [\[1\]](#) [\[2\]](#)

28. How do you handle high-cardinality categorical features?

High-cardinality categories can be handled using target encoding, frequency encoding, feature hashing, or grouping rare categories. Choice depends on cardinality level and algorithm requirements. [\[17\]](#) [\[18\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

29. What is PolynomialFeatures and when do you use it?

PolynomialFeatures creates interaction terms and polynomial features from existing features. It helps linear models capture non-linear relationships but increases dimensionality rapidly. [\[11\]](#) [\[5\]](#) [\[15\]](#) [\[1\]](#) [\[2\]](#)

30. Explain the concept of feature scaling and its importance.

Feature scaling normalizes different feature ranges to ensure equal contribution to model learning. Distance-based algorithms and gradient descent optimization require scaling for optimal performance. [\[6\]](#) [\[5\]](#) [\[7\]](#) [\[11\]](#) [\[1\]](#)

31. What is SimpleImputer and what strategies does it support?

SimpleImputer fills missing values using strategies like mean, median, most_frequent, or constant values. Choice depends on data distribution and missingness patterns. [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[3\]](#)

32. How do you create custom transformers in Scikit-Learn?

Custom transformers inherit from BaseEstimator and TransformerMixin, implementing fit() and transform() methods. They integrate seamlessly with pipelines and follow sklearn conventions. [\[15\]](#) [\[11\]](#) [\[1\]](#) [\[2\]](#) [\[5\]](#)

33. What is the purpose of normalize() function?

normalize() scales individual samples to unit norm (L1 or L2), useful for text classification and when sample-wise scaling is needed. It differs from StandardScaler which works column-wise. [\[7\]](#) [\[11\]](#) [\[1\]](#) [\[6\]](#) [\[5\]](#)

34. Explain quantile transformation and its benefits.

QuantileTransformer maps features to uniform or normal distribution, making algorithms less sensitive to outliers. It's robust to extreme values and can improve model performance. [\[18\]](#) [\[11\]](#) [\[1\]](#) [\[2\]](#) [\[5\]](#)

35. What is the difference between fit_transform() and using fit() then transform()?

fit_transform() is more efficient for transformers as it combines operations, while separate fit()/transform() allows applying learned parameters to new data. fit_transform() saves computation in training phase. [\[1\]](#) [\[2\]](#) [\[6\]](#) [\[5\]](#) [\[7\]](#)

Supervised Learning Algorithms (Questions 36-50)

36. How do you implement Linear Regression in Scikit-Learn?

Linear Regression is implemented using `LinearRegression()` class with `fit(X, y)` for training and `predict(X)` for predictions. It assumes linear relationship between features and target with minimal preprocessing requirements. [\[4\]](#) [\[2\]](#) [\[3\]](#) [\[5\]](#) [\[1\]](#)

37. What is the difference between Ridge and Lasso regression?

Ridge regression (L2 penalty) shrinks coefficients toward zero but keeps all features, while Lasso (L1 penalty) can drive coefficients to exactly zero, performing feature selection. ElasticNet combines both penalties. [\[2\]](#) [\[3\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

38. How do you implement Logistic Regression for classification?

`LogisticRegression()` handles binary and multi-class classification using maximum likelihood estimation. It provides probability estimates and works well with linear decision boundaries. [\[4\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

39. Explain Support Vector Machines in Scikit-Learn.

SVM finds optimal hyperplane separating classes with maximum margin using `SVC()` for classification and `SVR()` for regression. Kernel trick enables non-linear decision boundaries. [\[3\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#)

40. What are the different SVM kernels and when to use them?

Linear kernel for linearly separable data, RBF (Gaussian) for non-linear patterns, polynomial for interaction effects, and sigmoid for neural network-like behavior. Choice depends on data complexity and computational constraints. [\[5\]](#) [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[4\]](#)

41. How do you implement Random Forest in Scikit-Learn?

`RandomForestClassifier()` and `RandomForestRegressor()` combine multiple decision trees with bootstrap sampling and random feature selection. They reduce overfitting and provide feature importance. [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#)

42. What is the difference between Decision Trees and Random Forest?

Decision Trees are single models prone to overfitting, while Random Forest combines multiple trees to reduce variance and improve generalization. Random Forest also provides feature importance and handles missing values better. [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#) [\[7\]](#)

43. Explain k-Nearest Neighbors (k-NN) implementation.

KNeighborsClassifier() and KNeighborsRegressor() classify/predict based on k nearest neighbors in feature space. It's instance-based learning requiring no explicit training phase. [\[2\]](#) [\[3\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#)

44. What are the advantages and disadvantages of k-NN?

Advantages: simple concept, no assumptions about data distribution, works with multi-class problems. Disadvantages: computationally expensive, sensitive to curse of dimensionality, requires feature scaling. [\[4\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

45. How do you implement Naive Bayes in Scikit-Learn?

Naive Bayes variants include GaussianNB() for continuous features, MultinomialNB() for count data, and BernoulliNB() for binary features. They assume feature independence but work well in practice. [\[3\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#)

46. What is ensemble learning and how is it implemented?

Ensemble learning combines multiple models using VotingClassifier(), BaggingClassifier(), or boosting methods like AdaBoostClassifier(). It improves performance by reducing bias and variance. [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#)

47. Explain AdaBoost and its implementation.

AdaBoostClassifier() sequentially trains weak learners, increasing weights of misclassified samples. Each subsequent model focuses on previously misclassified examples. [\[1\]](#) [\[2\]](#) [\[3\]](#) [\[4\]](#) [\[5\]](#)

48. What is Gradient Boosting and how does it work?

GradientBoostingClassifier() builds models sequentially, each correcting residual errors of previous models. It optimizes differentiable loss functions and often achieves high performance. [\[7\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#)

49. How do you handle multi-class classification?

Multi-class classification is handled automatically by most algorithms, or explicitly using OneVsRestClassifier() and OneVsOneClassifier() for binary classifiers. Evaluation uses macro/micro-averaged metrics. [\[16\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#)

50. What is the difference between hard and soft voting in ensembles?

Hard voting uses majority vote of class predictions, while soft voting averages predicted probabilities. Soft voting generally performs better when classifiers provide reliable probability estimates. [\[2\]](#) [\[4\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

Unsupervised Learning (Questions 51-60)

51. How do you implement k-means clustering?

KMeans() partitions data into k clusters by minimizing within-cluster sum of squares. It requires specifying number of clusters and assumes spherical cluster shapes. [\[4\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

52. How do you determine optimal number of clusters?

Methods include elbow method (plot inertia vs k), silhouette analysis, gap statistic, and domain knowledge. Cross-validation and stability analysis also help determine appropriate k values. [\[19\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#)

53. What is DBSCAN and when do you use it?

DBSCAN() finds clusters of varying shapes and identifies outliers based on density. It doesn't require pre-specifying cluster count and handles noise well. [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#)

54. How do you implement PCA for dimensionality reduction?

PCA() finds principal components that maximize variance, reducing dimensionality while preserving information. It's used for visualization, noise reduction, and feature extraction. [\[15\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#)

55. What is the difference between PCA and LDA?

PCA maximizes variance regardless of labels (unsupervised), while LDA maximizes class separation (supervised). PCA preserves global structure, LDA optimizes discriminative power. [\[19\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#)

56. Explain hierarchical clustering in Scikit-Learn.

AgglomerativeClustering() creates cluster hierarchies by iteratively merging closest clusters. It provides dendrogram visualization and doesn't require pre-specifying cluster count. [\[7\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#)

57. What are the different linkage criteria in hierarchical clustering?

Linkage criteria include single (minimum distance), complete (maximum distance), average (mean distance), and ward (minimizes within-cluster variance). Choice affects cluster shape and size. [\[19\]](#) [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#)

58. How do you perform anomaly detection in Scikit-Learn?

Anomaly detection uses IsolationForest(), OneClassSVM(), or LocalOutlierFactor(). Methods identify observations that deviate significantly from normal patterns. [\[1\]](#) [\[2\]](#) [\[4\]](#) [\[5\]](#) [\[7\]](#)

59. What is t-SNE and when do you use it?

TSNE() performs non-linear dimensionality reduction for visualization, preserving local structure. It's excellent for 2D/3D visualization but computationally expensive and not suitable for new data projection. [\[2\]](#) [\[4\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#)

60. How do you evaluate clustering performance?

Evaluation uses silhouette score, adjusted rand index, normalized mutual information, and visual inspection. Internal metrics assess cluster quality, external metrics compare to ground truth. [\[19\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

Model Selection and Validation (Questions 61-70)

61. What is GridSearchCV and how do you use it?

GridSearchCV() performs exhaustive hyperparameter search using cross-validation. It evaluates all parameter combinations and selects best performing configuration. [\[9\]](#) [\[15\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

62. Explain the difference between GridSearchCV and RandomizedSearchCV.

GridSearchCV tests all parameter combinations while RandomizedSearchCV samples random combinations. RandomizedSearchCV is more efficient for large parameter spaces. [\[15\]](#) [\[4\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

63. What is cross_val_score() and how does it work?

cross_val_score() evaluates model performance using cross-validation, returning scores for each fold. It provides robust performance estimates by testing on multiple data splits. [\[12\]](#) [\[13\]](#) [\[14\]](#) [\[10\]](#) [\[9\]](#)

64. Explain different cross-validation strategies.

Strategies include KFold (random splits), StratifiedKFold (maintains class proportions), TimeSeriesSplit (temporal data), and LeaveOneOut. Choice depends on data characteristics and problem type. [\[13\]](#) [\[14\]](#) [\[10\]](#) [\[12\]](#) [\[9\]](#)

65. What is stratified cross-validation and why is it important?

StratifiedKFold maintains class distribution proportions across folds, crucial for imbalanced datasets. It ensures each fold represents the overall population. [\[14\]](#) [\[10\]](#) [\[12\]](#) [\[13\]](#) [\[9\]](#)

66. How do you handle data leakage in cross-validation?

Data leakage is prevented by applying preprocessing within each cross-validation fold, not on entire dataset. Use pipelines to ensure transformations are learned only on training data. [\[20\]](#) [\[10\]](#) [\[13\]](#) [\[6\]](#) [\[15\]](#)

67. What are learning curves and how do you plot them?

Learning curves plot model performance vs training set size using `learning_curve()`. They diagnose bias/variance issues and determine if more data would help. [\[10\]](#) [\[12\]](#) [\[9\]](#) [\[1\]](#) [\[2\]](#)

68. Explain validation curves and their purpose.

Validation curves plot performance vs single hyperparameter values using `validation_curve()`. They help identify optimal parameter values and detect overfitting/underfitting. [\[12\]](#) [\[9\]](#) [\[10\]](#) [\[1\]](#) [\[2\]](#)

69. What is nested cross-validation?

Nested cross-validation uses outer loop for model evaluation and inner loop for hyperparameter tuning. It provides unbiased performance estimates when hyperparameter optimization is involved. [\[13\]](#) [\[14\]](#) [\[9\]](#) [\[10\]](#) [\[12\]](#)

70. How do you perform model comparison in Scikit-Learn?

Model comparison uses `cross_validate()` with multiple algorithms, statistical tests for significance, and metrics appropriate to the problem. Consider computational cost and interpretability requirements. [\[10\]](#) [\[16\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

Advanced Topics and Practical Applications (Questions 71-80)

71. What are Scikit-Learn pipelines and why are they important?

`Pipeline()` chains preprocessing steps and models into single object, ensuring consistent transformations and preventing data leakage. They enable reproducible workflows and easy hyperparameter tuning. [\[21\]](#) [\[15\]](#) [\[5\]](#) [\[1\]](#) [\[2\]](#)

72. How do you create complex pipelines with ColumnTransformer?

`ColumnTransformer()` applies different transformers to different column subsets, enabling complex preprocessing workflows. It integrates seamlessly with pipelines for end-to-end processing. [\[15\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

73. What is FeatureUnion and when do you use it?

`FeatureUnion()` concatenates outputs from multiple transformers applied to same data. It's useful for combining different feature extraction methods. [\[11\]](#) [\[5\]](#) [\[15\]](#) [\[1\]](#) [\[2\]](#)

74. How do you handle imbalanced datasets in Scikit-Learn?

Imbalanced datasets are handled using `class_weight` parameter, SMOTE oversampling, undersampling, or specialized metrics like `balanced_accuracy`. Consider business costs of different error types. [\[4\]](#) [\[5\]](#) [\[7\]](#) [\[1\]](#) [\[2\]](#)

75. What are custom scorers and how do you create them?

Custom scorers are created using `make_scorer()` function to define domain-specific evaluation metrics. They integrate with cross-validation and hyperparameter tuning workflows. ^{[16] [10] [5] [1] [2]}

76. How do you deploy Scikit-Learn models in production?

Model deployment involves serialization with `joblib`, creating REST APIs, containerization, and monitoring performance. Consider model versioning, A/B testing, and retraining schedules. ^{[5] [7] [1] [2] [4]}

77. What is model interpretability in Scikit-Learn?

Model interpretability includes feature importance from tree-based models, coefficients from linear models, and permutation importance. External tools like LIME and SHAP provide additional explanation methods. ^{[7] [1] [2] [4] [5]}

78. How do you handle text data in Scikit-Learn?

Text data is processed using `CountVectorizer()`, `TfidfVectorizer()`, or `HashingVectorizer()` to convert text to numerical features. Preprocessing includes tokenization, stop word removal, and n-gram extraction. ^{[1] [2] [4] [5] [7]}

79. What are the best practices for using Scikit-Learn?

Best practices include using pipelines, proper cross-validation, feature scaling, handling missing data appropriately, choosing appropriate metrics, and documenting preprocessing steps. Always validate on unseen data. ^{[15] [2] [4] [5] [1]}

80. How do you optimize Scikit-Learn model performance?

Performance optimization includes hyperparameter tuning with `GridSearchCV`/`RandomizedSearchCV`, feature selection, ensemble methods, and algorithm selection based on data characteristics. Consider computational constraints and interpretability requirements. ^{[2] [4] [5] [7] [1]}

These 80 questions represent the comprehensive knowledge areas that interviewers consistently test across all Scikit-Learn positions. Mastering both theoretical understanding and practical implementation of these concepts will significantly enhance your interview performance and demonstrate deep expertise in machine learning with Scikit-Learn. ^{[5] [1] [2]}
